Mobilise-D Project

The Mobilise-D project aim at developing a system to evaluate people's gait based on **digital technologies** to monitor the following health condition:

- > Multiple Sclerosis
- > Chronic Obtrusive Pulmonary Disease
- > Parkinson's Disease
- > Chronic Heart Failure
- > Periprosthetic Femoral Fracture

More than **300 professionals** from **34 participating universities, hospitals,** and **industry,** representing **11 countries,** with the necessary technical, clinical, and regulatory expertise are working together over a five-year period.

Biomechanics

Clinicians

Data Scientists

Patient
representatives

Pharmaceutics

Effect on mobility

Multiple Sclerosis (MS)

- > **limit walking endurance**
- > cause **weakness, poor balance, numbness, or spasticity**

Chronic Obstructive Pulmonary Disease (COPD)

- > increase **duration between steps**
- > increase **step duration variability**

Parkinson's Disease (PD)

- > gait **slowness**
- > increased **step variability**
- > **poor postural control**

Chronic Heart Failure (CHF)

- > can reduce **walking capacity**

Periprosthetic Femoral Fracture (PFF)

- > affect **gait** and **balance** functions

Evaluating mobility in clinical context

CURRENTLY

Medical questionnaires

- ✗ Imprecise: Health status ranked on small scale (e.g. 0 to 5)
- ✗ Subjective: Depend on the context (different clinicians, relative to the previous patient, ...)

2.12 WALKING AND BALANCE

Over the past week, have you usually

- | | |
|--------------|---|
| 0: Normal: | Not at all (no problems) |
| 1: Slight: | I am slightly slower than other people |
| 2: Mild: | I occasionally use a cane or another person |
| 3: Moderate: | I usually use a cane or another person |
| 4: Severe: | I usually use a cane or another person |

In-lab evaluation

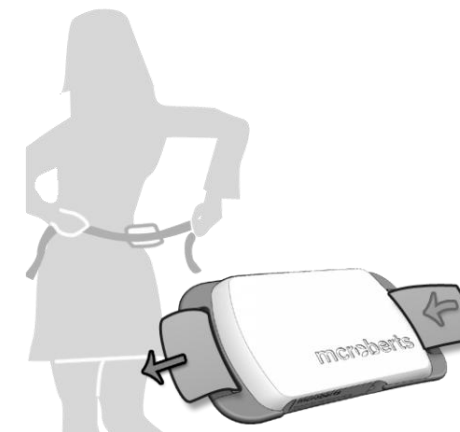

- ✗ Not convenient: require patient to come to the lab for a long period of time
- ✗ Not ecologically valid: Snapshot rather than continuous change

WITH ACCELEROMETRY SENSORS

Real-life mobility tracking

- ✓ Precise: provides quantitative metrics on how people walk
- ✓ Objective: rely on accelerometry recording
- ✓ Convenient: easy to equip
- ✓ Ecologically valid: can be wear at all time

Project overview

TVS – Technical Validation Study

CVS - Clinical Validation Study

from **sensor data** to **mobility outcomes**

from **mobility outcomes** to **health status**

Scatterplots matrix

3D Scatterplot

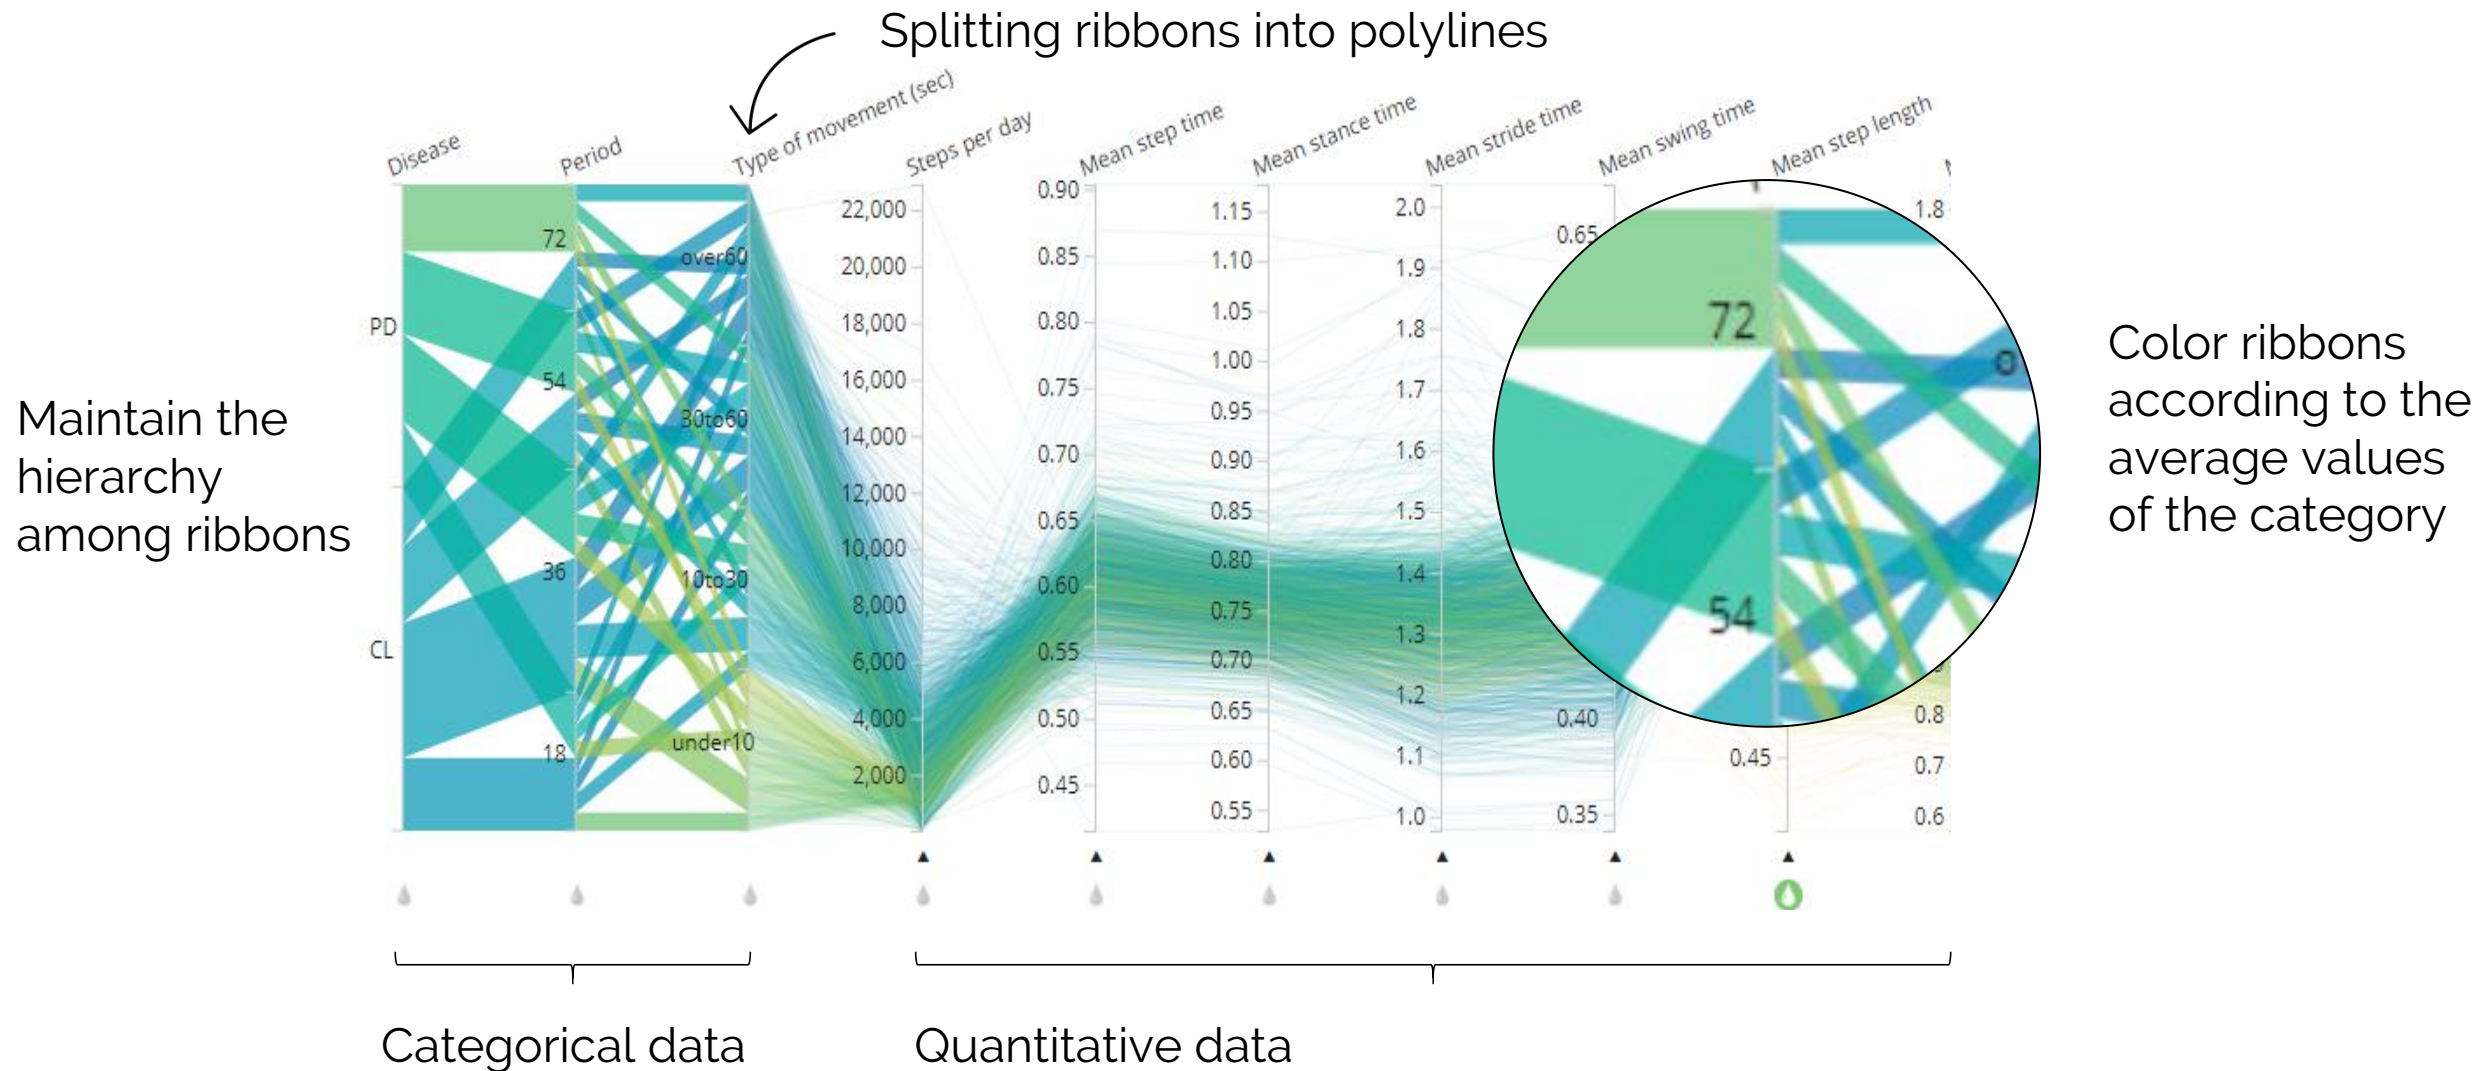

Parallel Bubble

Limits

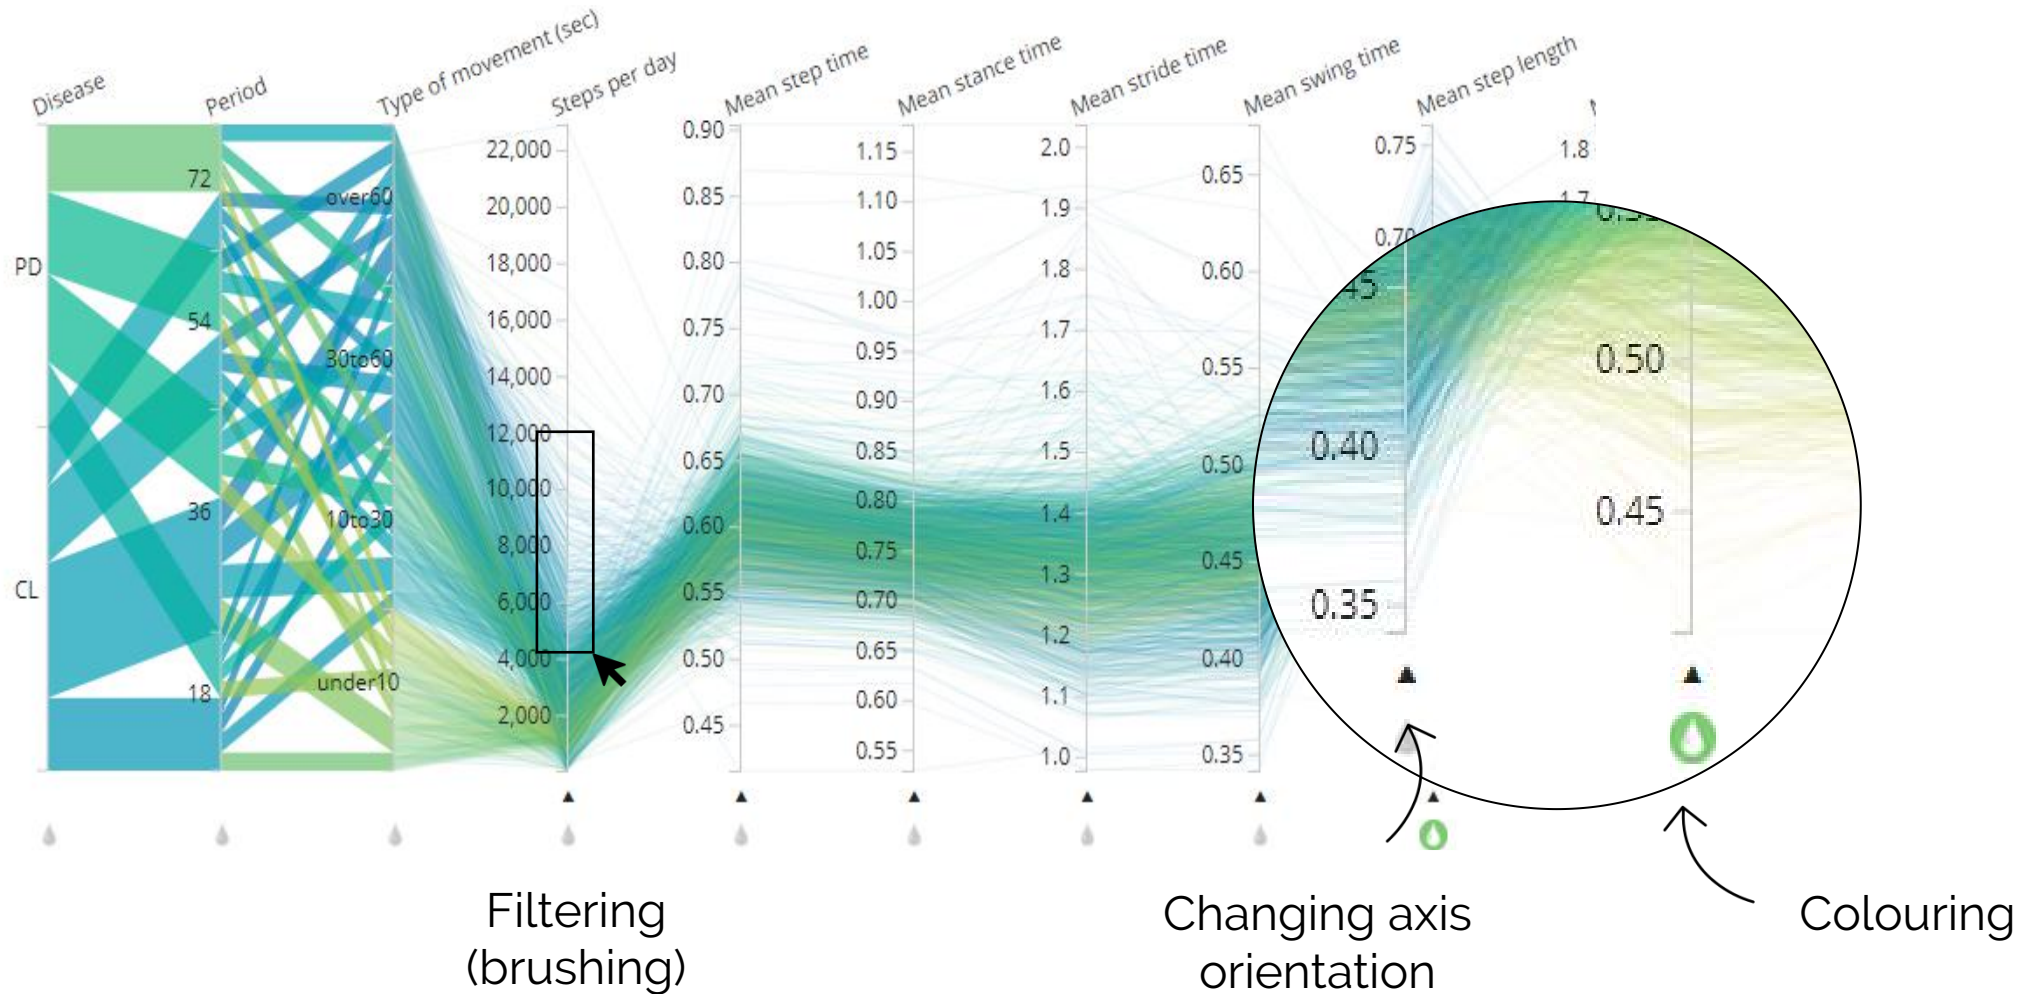

- No categorial and quantitative data combined
- or Loss of frequency information
- or Loss of precision
- or Limited correlation

Our solution for heterogeneous data

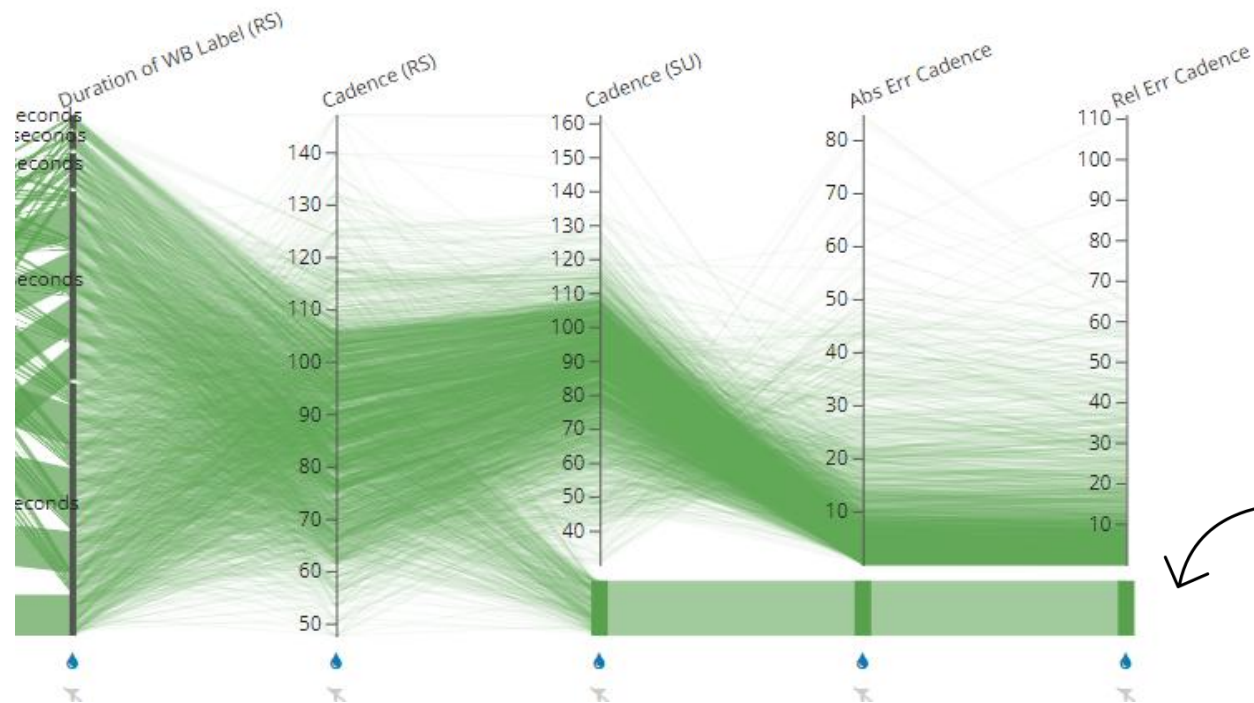

Parallel axis features

↔ Changing axis order

Missing values

Colouring the missing ribbon with mean value

Relying on a ribbon to display frequency

Evaluation

Qualitative study

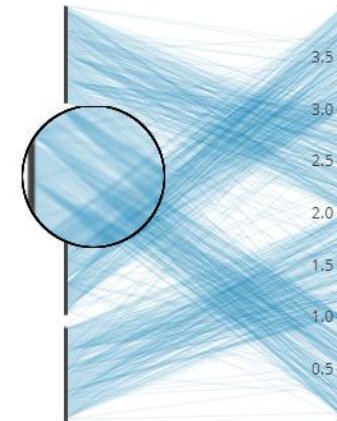

Are experts able to better perform their tasks?

- > identification of pipeline errors
- > identification of outliers
- > identification of correlation

Quantitative evaluation

Is the junction between ribbons and polyline extend the correlation properties of existing work?

- > some identifications are faster
- > some identifications are more accurate
- > it allows to correlate more dimensions

Additional Information

Technology

- > JavaScript d3.js
- > Two data access versions
 - CSV loading
 - Link to data base with Flask

Fully data-dynamic

- > Any data can be loaded as long as categorical and quantitative data are identified
- > Currently working on
 - community behaviour analysis results
 - network flow analysis

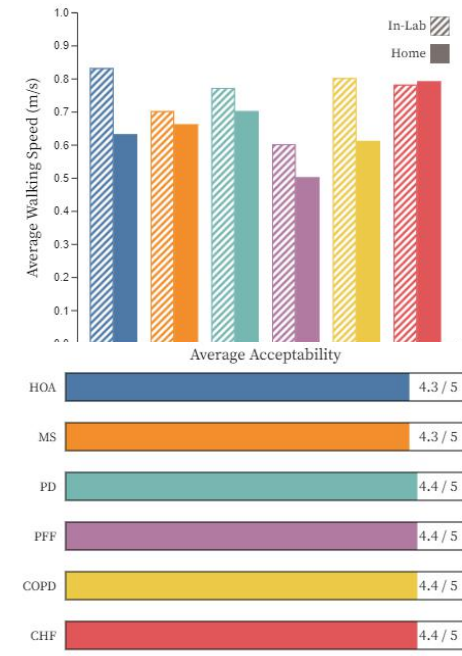

Not available on git hub yet

- > will be available at the end of the project
- > some features are still under publication process
- > contact me if you want to access older version: alma.cantu@newcastle.ac.uk

Future work

Aggregation technique

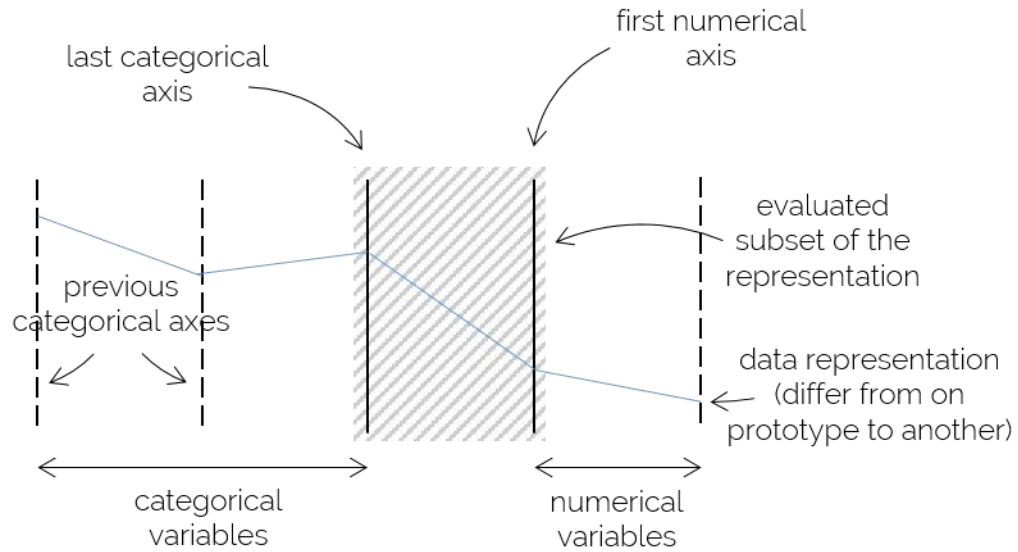

- Healthy Older Adults (HOA)
- Multiple Sclerosis (MS)
- Parkinson's Disease (PD)
- Proximal Femoral Fracture (PFF)
- Chronic Obstructive Pulmonary Disease (COPD)
- Congestive Heart Failure (CHF)

Visualization for patients

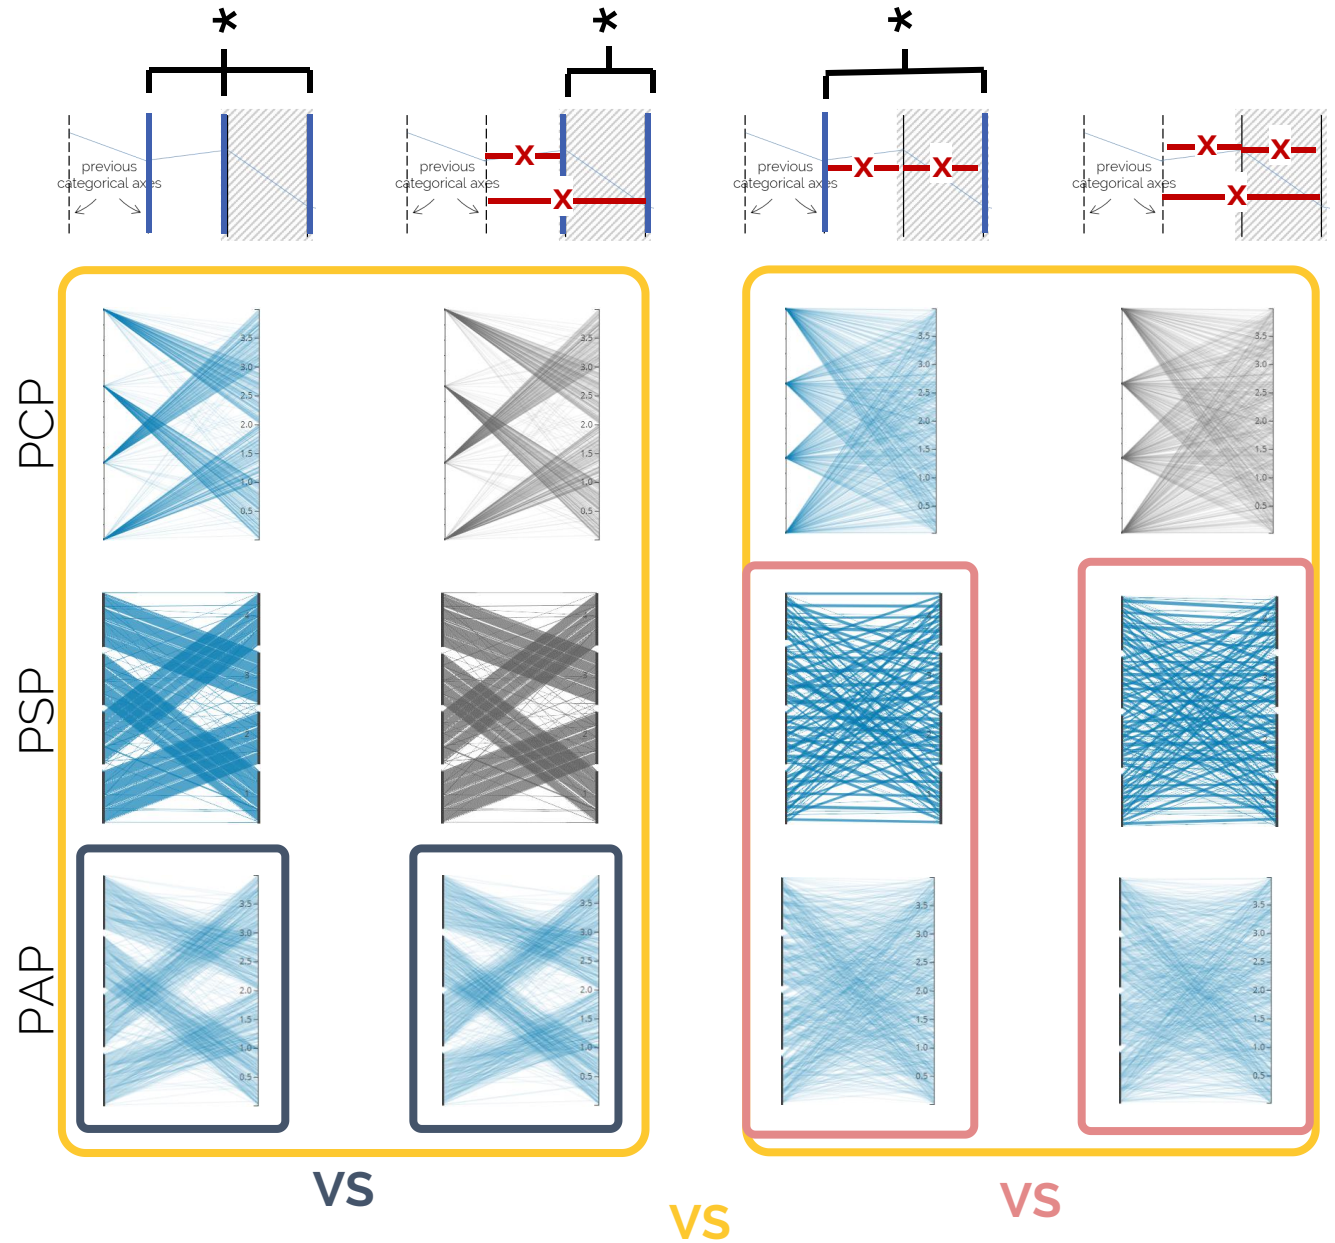

Thank you for your attention
